

USDL group workload

Fill in packages/hardhat/contracts/USDLEngine.sol, in this order.

Order	Person	What to write	Finished when
1	A	addCollateral calculateCollateralValue	ETH can be deposited and its dollar value shows on the site.
2	B	_getCurrentExchangeRate _accrueInterest _getUSDLTToShares setBorrowRate	Debt grows with time, and changing the borrow rate saves the interest already earned.
3	C	getCurrentDebtValue calculatePositionRatio _validatePosition mintUSDL repayUpTo withdrawCollateral	A user can mint up to 150%, repay, and withdraw only while the position stays safe.
4	D	isLiquidatable liquidate borrow rate >= savings rate	A second account can repay an unsafe position and take the ETH plus the 10% bonus.
5	E	yarn simulate yarn interest-rate-controller	The group can show the price falling below \$1 and coming back.

Each person's turn

1. git pull
2. Edit only your functions
3. Test: yarn chain, yarn deploy, yarn start
4. git add, git commit, git push

Only one person edits this file at a time.

The project is finished when

1. Deposit ETH and mint USDL
2. Repay and withdraw
3. Liquidate from a second account
4. Simulation brings the price back toward \$1

Sepolia only if the course asks for a public link.
